## **Combined control & balancing valves**

Pressure independent balancing and control valve

Engineering  
**GREAT** Solutions

# KTM 50

High-performing pressure-independent temperature control valve for variable flow heating and cooling systems. Particularly effective in situations requiring high temperatures and/or pressure drops, e.g. for the primary side of district heating and industrial cooling. Also suitable for use on the secondary side in district heating and comfort cooling systems. Ductile iron body - painted with duasolid offering good rust protection.

## Key features

- > **Special internal geometry**  
Allows big pressure drop without noise.
- > **Adjustable flow**  
Ensures the design flow.
- > **Adapters**  
For use with most available actuators.

## Technical description

### Application:

Heating and cooling systems with variable flow.

### Function:

Temperature control, differential pressure control over an integrated control valve and flow control.

### Dimensions:

DN 100-200

### Pressure class:

PN 16 or PN 25

### Max. differential pressure ( $\Delta p_V$ ):

1600 kPa = 16 bar

### Pressure drop in the throttle ( $F_c$ ):

15 kPa

### Temperature:

Max. working temperature: 150°C

Min. working temperature: -10°C

### Media:

Water or neutral fluids, water-glycol mixtures.

### Material:

Valve body: Ductile iron EN-GJS-400

Diaphragms and gaskets: EPDM

Valve plug: Stainless steel with EPDM insert

### Surface treatment:

Duasolid painting.

### Marking:

TA, DN, PN, Kvs and flow direction arrow.

### Flanges:

According to EN-1092-2:1997, type 21.

### Max. lift of the control valve:

20 mm

### Leakage rate:

Tight sealing

## Operating function

Bonnet for temperature control (1) and diaphragm operated differential pressure controller (2) are built in one valve body. Pressure upstream of the control valve acts through an external impulse pipe (V+) to bottom side of the diaphragm (3).

Pressure downstream control valve (V-) acts to top side of diaphragm together with a spring (4) force.

The differential pressure controller pressure relieves the control valve and at the same time limits the flow to the value preset via lift limitation of control valve. The differential pressure controller keeps 15 kPa across the control valve.

Valve is protected against overload with a safety spring (5).

1. Bonnet
2.  $\Delta p$  controller
3. Diaphragm
4. Spring
5. Safety spring
6. Vent screw

V+ External impulse pipe

V- Internal impulse pipe

## Sizing

Select the size according to maximum flow. Control the pressure drop in the valve by using the formula:

Fc is the constant pressure drop in the throttle (15 kPa).

$$\Delta p_{\min} = F_c + \left( 0.01 \frac{q}{K_{vd}} \right)^2 \quad [l/h, \text{kPa}]$$

## Installation

Flow direction is shown by the arrow on the valve body. Install the valve so that the flow adjustment scale is visible and measuring points (if used) are accessible.

Check the allowed positions of the actuator. Installation of a strainer upstream of the valve is recommended. Install the actuator after undertaken a leakage test.

Installation of a balancing valve STAF is recommended to enable flow measurement, commissioning and trouble-shooting with IMI Hydronic Engineering's balancing or measuring instruments.

### Normal pipe fittings

Try to avoid mounting taps and pumps immediately before the valve.

### Application example

## Setting

Release the fixing nut (7). Turn the flow setting screw (8) clockwise to the position of 0,0 turns. Turn the flow setting screw **anticlockwise** corresponding to the number of turns on the flow chart. Tighten the fixing nut.

Fc is constant pressure drop in the control valve = 15 kPa.

Kvd = Is the Kv value of the differential pressure control component when fully open, used to calculate the minimum pressure drop necessary for the valve to operate according to the formula found under "Sizing".
