

KTM 512

– NPT threads/ANSI flanges

Combined control & balancing valves

Pressure independent balancing and control valve –
DN 15-125

KTM 512

– NPT threads/ANSI flanges

High-performing and compact, these pressure-independent control valves for variable flow heating and cooling systems are particularly effective in situations requiring high temperatures and/or pressure drops. They are also suitable for use on the secondary side in district heating and comfort cooling systems. Rust protection is assured due to the electrophoretically painted ductile iron body, while the plug delivers valve characteristic, suitable for modulating control.

Key features

> Inline design

Inline flow allows high pressure drops without noise.

> Adjustable flow

Ensures the design flow.

> Adapters

For use with most available actuators.

Technical description

Application:

Heating and cooling systems.

Functions:

Control EQM
Pre-setting (max. flow)
Differential pressure control
Measuring (ΔH , t , q)
Isolation (for use during system maintenance)

Dimensions:

DN 15-125

Pressure class:

DN 15-50: PN 25
DN 65-125: Class 150

Differential pressure (Δp_V):

Max. differential pressure:
1600 kPa = 16 bar (ΔH_{max})
Min. differential pressure:
Low flow (LF): 24 kPa (ΔH_{min})
Normal flow (NF): 40 kPa (ΔH_{min})
High flow (HF): 80 kPa (ΔH_{min})
(Valid for max. position, fully open. Other positions will require lower differential pressure, check with the software HySelect.)

Flow range:

The flow (q_{max}) can be set within the range:

DN 15/20 (LF): 120-800 l/h
DN 15/20 (NF): 150-1000 l/h
DN 15/20 (HF): 210 - 1400 l/h
DN 25/32 (LF): 480 - 3200 l/h
DN 25/32 (NF): 570 - 3800 l/h
DN 25/32 (HF): 810 - 5400 l/h
DN 40/50 (LF): 1140 - 7600 l/h
DN 40/50 (NF): 1400 - 9500 l/h
DN 40/50 (HF): 1900 - 12600 l/h
DN 65 (LF): 2300-15400 l/h
DN 65 (NF): 3240-21600 l/h
DN 65 (HF): 4440 - 29600 l/h
DN 80 (LF): 2500 - 16700 l/h
DN 80 (NF): 3400 - 22700 l/h
DN 80 (HF): 4900 - 32500 l/h
DN 100 (LF): 4000 - 26600 l/h
DN 100 (NF): 6200 - 41200 l/h
DN 100 (HF): 7500 - 50600 l/h
DN 125 (LF): 5350 - 35600 l/h
DN 125 (NF): 8200 - 54900 l/h
DN 125 (HF): 10000 - 66800 l/h
 $q_{max} = l/h$ at each setting and fully open valve plug.

Temperature:

Max. working temperature:
- with measuring points: 120°C
- without measuring points: 150°C
Min. working temperature: -10°C

Media:

Water or neutral fluids, water-glycol mixtures (0-57%).

Max. lift of the control valve:

DN 15-50: 10 mm
DN 65-125: 20 mm

Leakage rate:

Tight sealing

Characteristics:

Indicative shaped EQM, best suited for modulating control.

Material:

Valve body: Ductile iron EN-GJS-400-15
Valve insert: Brass
Throttle plug: Stainless steel
Valve plug: Stainless steel
Valve seat: Stainless steel
Seat seal: EPDM
Spindle: Stainless steel
 Δp insert: Stainless steel (plastic components for DN 15-50)
 Δp seat: Ryton plastic
Springs: Stainless steel

Surface treatment:

Electrophoretic painting.

Marking:

IMI TA, DN, PN, Kvs, material and flow direction arrow.

Connection:

DN 15-50: External threads according to ISO 228. (Separate connections with NPT threads.)
 DN 65-125: Flanges according to ASME/ANSI B16.42 Class 150.

Actuators:

DN 15-50: TA-Slider 500
 DN 65: TA-Slider 750*
 DN 80 LF/NF: TA-Slider 750*
 DN 80 HF: TA-Slider 1600*
 DN 100 LF: TA-Slider 750*
 DN 100 NF/HF: TA-Slider 1600*
 DN 125: TA-Slider 1600*

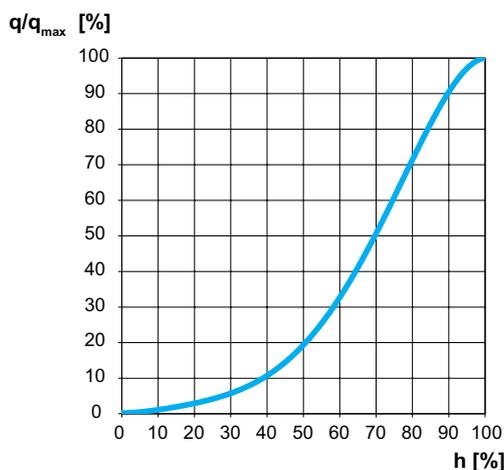

*) Adapter 52 757-907 needed.

For more details on actuators, see separate technical leaflets.

KTM 512 can be equipped with adapters for the most common actuators - see "Adapters for actuators".

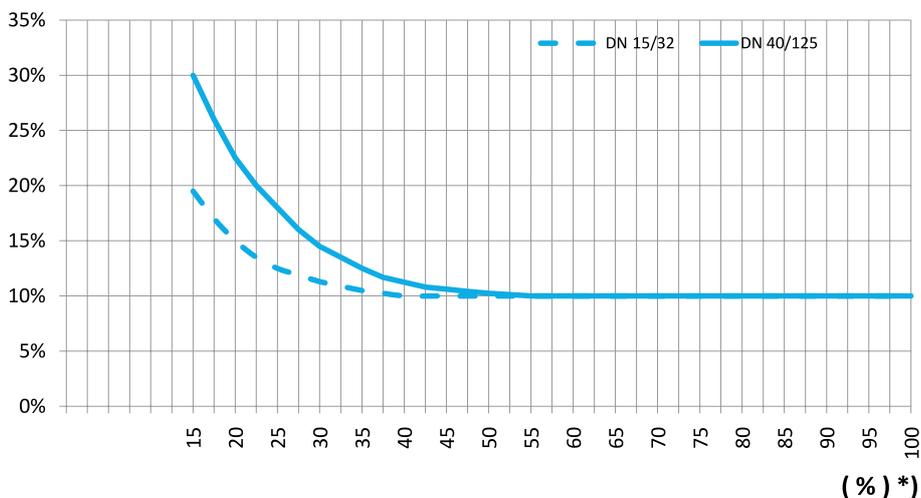

The max. lift of the actuator must be checked. In the case of a shorter lift the maximum achieved flow will be decreased. Consult your local sales office for details.

Valve characteristics

Measuring accuracy

Kv deviation at different settings (LF/NF/HF)

*) Setting (%) of fully open valve.

Correction factors

The flow calculations are valid for water (+20°C). For other liquids with approximately the same viscosity as water (≤ 20 cSt = $3^\circ\text{E}=100\text{S.U.}$), it is only necessary to compensate for the specific density. However, at low temperatures, the viscosity increases and laminar flow may occur in the valves. This causes a flow deviation that increases with small valves, low settings and low differential pressures. Correction for this deviation can be made with the software HySelect or directly in our balancing instruments.

Noise

In order to avoid noise in the installation, the valve must be correctly installed.

Performance of the valves is subject to water quality being of an appropriate regional standard (including particulate and free, entrained and dissolved gases compliant with VDI 2035), failure to do so can result in shortened life span, reduced controllability and noise.

Sizing

The valve is capable of achieving a maximum flow according to the product tables.

Min. differential pressure:

Low flow (LF): 24 kPa (ΔH_{\min})

Normal flow (NF): 40 kPa (ΔH_{\min})

High flow (HF): 80 kPa (ΔH_{\min})

(Valid for max. position, fully open. Other positions will require lower differential pressure, check with the software HySelect.)

Installation

Install the valve in the return pipe, downstream the consumer, or in the inlet pipe, upstream the consumer. Flow direction is shown by the arrow on the valve body.

Install the valve so that venting is possible and the flow adjustment scale is visible. Check allowed positions of the actuator.

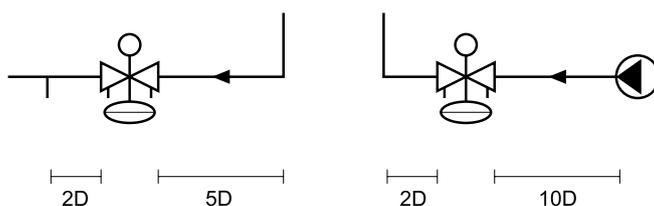

Installation of a strainer upstream of the valve is recommended.

When filling, vent the body by using the venting screws.

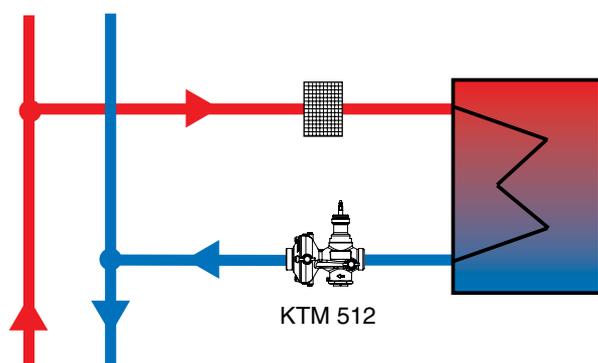

Normal pipe fittings

Try to avoid mounting taps and pumps immediately before the valve.

Installation recommendation for accurate measurement due to distortion of fully developed turbulent flow profile.

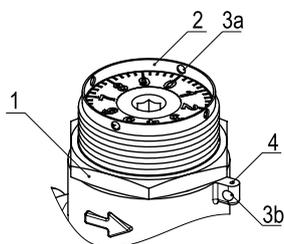

Application example

Setting

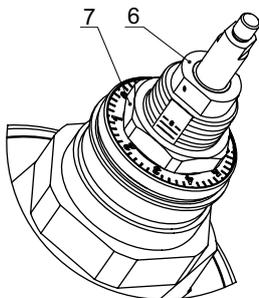

DN 15-50

Release the fixing nut (1). Turn the flow setting screw (2) clockwise to the position of 0,0 turns. Turn the flow setting screw **anticlockwise** corresponding to the number of turns on the flow chart. Tighten the fixing nut. The flow setting can be sealed by using the holes (3a and 3b) on the flow setting screw and the valve body.

DN 65-125

Release the fixing nut (7). Turn the flow setting screw (6) clockwise to the position of 0,0 turns. Turn the flow setting screw **anticlockwise** corresponding to the number of turns on the flow chart. Tighten the fixing nut.

Detailed instructions are delivered with the valves.

Table - Example:

Valid table is delivered with each valve.

KTM 512 DN 15/20 LF					
Position - Einstellung					
	0,0	1,0	2,0	3,0	4,0
,0	0,02	0,29	0,49	0,59	0,72
,1	0,05	0,31	0,50	0,60	0,73
,2	0,07	0,33	0,51	0,62	0,74
,3	0,10	0,35	0,52	0,63	0,75
,4	0,13	0,37	0,53	0,64	0,76
,5	0,16	0,39	0,54	0,66	0,77
,6	0,18	0,41	0,55	0,67	0,78
,7	0,21	0,43	0,56	0,68	0,79
,8	0,24	0,45	0,57	0,69	0,80
,9	0,26	0,47	0,58	0,71	0,81

Flow - Volumenstrom (m³/h)

$p_1=4\text{bar}$ $p_2=3\text{bar}$ $\Delta p=1\text{bar}$
 $\Delta p \ll 1 \text{ bar} \Rightarrow \text{Flow} \approx$

Actuator recommendation and needed actuation force

The minimum actuator force required to operate the KTM 512 valves is dependent upon the maximum inlet pressure of the system. The following table shows the actuator recommendations from IMI Hydronic Engineering and needed actuator force.

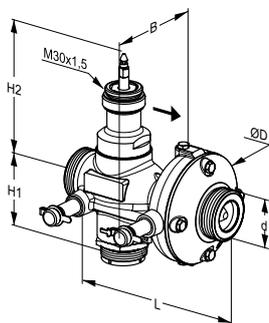

Valve		Stroke [mm]	Theoretical minimum actuator force [N] at different static inlet pressures				
			≤5 bar	≤10 bar	≤15 bar	≤20 bar	≤25 bar
